Attornev's Docket No.: 17638-008US1 / INTEU/P31704US

AMENDMENTS TO THE CLAIMS:

This listing of claims replaces all prior versions and listings of claims in the application:

LISTING OF CLAIMS:

1. (Currently Amended) A method of operating an electrochemical fuel cell stack

comprising a plurality of fuel cells, each of the fuel cells comprising an anode, an ion transfer

membrane, and a cathode, the method comprising:

delivering fluid fuel to one or more fluid flow channels in each anode of one or more fuel

cells in the electrochemical fuel cell stack;

delivering fluid oxidant to one or more fluid flow channels in each cathode of the one or

more fuel cells;

exhausting reaction by-products and unused oxidant from the one or more fluid flow

channels in each cathode of the one or more fuel cells; and

delivering a sufficient quantity of liquid water to the one or more fluid flow channels in

each cathode of the one or more fuel cells such that a relative humidity of 100% is maintained

throughout the one or more fluid flow channels in each cathode of the one or more fuel cells;

wherein delivering the sufficient quantity of liquid water comprises:

determining, for each of a plurality of currents, a maximum voltage for the one or

more fuel cells as a function of liquid water flow rate, the each of a plurality of currents

being within a normal range of operating conditions of the one or more fuel cells;

Applicants: Jeremy Stephen Matcham, et al.

determining a calibration function expressing a minimum liquid water flow rate as

a function of current and/or air stoichiometry, the minimum liquid water flow rate being

based on a corresponding maximum voltage; and

delivering at least the minimum liquid water flow rate for a corresponding current

drawn from the one or more fuel cells and/or for the air stoichiometry, the delivered

minimum liquid water flow rate being determined by the calibration function.

2. (Previously Presented) The method of claim 1, wherein the one or more fuel cells

comprises less than all fuel cells in the electrochemical fuel cell stack.

3. (Previously Presented) The method of claim 1, wherein the one or more fuel cells

comprises all fuel cells in the electrochemical fuel cell stack.

4. (Currently Amended) The method of claim 1, further comprising:

increasing a quantity of liquid water delivered to one or more fluid flow channels of each

cathode of the one or more fuel cells as a function of fuel cell current in order to maintain a water

factor greater than 1.0 for all currents within a normal an operating range of the one or more fuel

cells.

5 and 6. (Canceled)

7. (Previously Presented) The method of claim 1, wherein the calibration function is

determined for air stoichiometry in a range 1.1 to 10.

8. (Previously Presented) The method of claim 1, wherein the calibration function is

determined for air stoichiometry in a range 1.4 to 4.0.

9. (Previously Presented) The method of claim 1, wherein delivering the sufficient

quantity of liquid water comprises delivery of a water factor of at least 1.5.

10. (Previously Presented) The method of claim 1, wherein delivering the sufficient

quantity of liquid water comprises delivery of a water factor of at least 3.

11. (Previously Presented) The method of claim 1, wherein delivering the sufficient

quantity of liquid water comprises delivery of a water factor of less than 40.

12. (Previously Presented) The method of claim 1, wherein delivering the sufficient

quantity of liquid water comprises delivery of a water factor in the range from 3 to 6.

13. (Previously Presented) The method of claim 1 further comprising:

temporarily permitting delivery of a quantity of liquid water to one or more fluid flow

channels of a cathode of the one or more fuel cells such that a relative humidity of less than

100% is maintained when an exhaust temperature of the cathode is below a predetermined

threshold corresponding to a sub-optimal operating temperature.

14. (Previously Presented) The method of claim 13, which is applied upon start-up of

the fuel cell.

15. (Previously Presented) The method of claim 1, wherein a fuel cell among the one or

more fuel cells is operated such that, for any measured fuel cell power delivery, a liquid water

injection rate into a cathode of the fuel cell and/or gas flow through the cathode are controlled to

ensure that there is more liquid water in all regions of a surface of the cathode than can be

evaporated in prevailing temperature and pressure conditions.

16. (Previously Presented) The method of claim 15, which is performed on a plurality of

fuel cells in the electrochemical fuel cell stack having a common oxidant supply manifold and a

common water injection manifold such that, for any measured stack power delivery, liquid water

injection rate into the common water injection manifold and/or gas flow rate in the common

oxidant supply manifold are controlled to ensure that there is more liquid water in all regions of

cathode surfaces of all of the plurality of fuel cells than can be evaporated in prevailing

temperature and pressure conditions.

17. (Currently Amended and Withdrawn) An electrochemical fuel cell assembly

comprising:

an electrochemical fuel cell stack comprising a plurality of fuel cells, each of the fuel

cells comprising:

an anode fluid flow field plate having one or more anode fluid flow

channels therein;

an ion transfer membrane; and

a cathode fluid flow field plate having one or more cathode fluid flow

channels therein;

a mechanism for delivering configured to deliver fluid fuel to one or more anode fluid

flow channels of one or more fuel cells in the electrochemical fuel cell stack;

a mechanism for delivering configured to deliver fluid oxidant to one or more cathode

fluid flow channels of the one or more fuel cells; and

a water injection mechanism for delivering configured to deliver a sufficient quantity of

liquid water to the one or more cathode fluid flow channels such that a relative humidity of

100% is maintained throughout the one or more cathode fluid flow channels during normal

operating conditions of the one or more fuel cells; and

a controller configured to control delivery of wherein delivering the sufficient quantity of

liquid water, the controller being configured (i) to determine comprises: determining, for each of

a plurality of currents, a maximum voltage for the one or more fuel cells as a function of liquid

water flow rate, the each of a plurality of currents being within a normal range of operating

conditions of the one or more fuel cells[[;]], (ii) to determine determining a calibration function

expressing a minimum liquid water flow rate as a function of current and/or air stoichiometry,

the minimum liquid water flow rate being based on a corresponding maximum voltage[[;]], and

(iii) to control delivery of delivering at least the minimum liquid water flow rate for a

corresponding current drawn from the one or more fuel cells and/or for the air stoichiometry, the

delivered minimum liquid water flow rate being determined by the calibration function.

18. (Withdrawn) The assembly of claim 17, wherein the water injection mechanism

comprises a pump and a controller.

19. (Withdrawn) The assembly of claim 18, wherein the controller comprises a voltage

sensor for sensing a fuel cell voltage.

20. (Withdrawn) The assembly of claim 19, wherein the controller is configured to

operate in a calibration mode comprising determining, for each of the plurality of currents, the

maximum voltage for the one or more fuel cells as a function of liquid water flow rate.

21. (Withdrawn) The assembly of claim 20, wherein the calibration mode further

comprises determining the calibration function expressing the minimum liquid water flow rate as

a function of current and/or air stoichiometry.

Filed : September 28, 2007 Page : 8 of 18

22. (Currently Amended and Withdrawn) The assembly of claim 18, further comprising:

Attornev's Docket No.:

17638-008US1 / INTEU/P31704US

a current sensor for sensing current flow through the one or more fuel cells in the

electrochemical fuel cell stack;

wherein the controller is configured to control a water injection rate to maintain delivery

of a water factor greater than 1.0 for all currents within a normal an operating range of the one or

more fuel cells.

23. (Withdrawn) The assembly of claim 22, wherein the controller is configured to

control the water injection rate to maintain delivery of a water factor of at least 1.5.

24. (Withdrawn) The assembly of claim 22, wherein the controller is configured to

control the water injection rate to maintain delivery of a water factor of less than 40.

25. (Withdrawn) The assembly of claim 22, wherein the controller is configured to

control the water injection rate to maintain delivery of a water factor of at least 3.

26. (Withdrawn) The assembly of claim 18, wherein the controller is configured to

control the water injection rate to maintain of delivery of a water factor in a range from 3 to 6.

27. (Currently Amended and Withdrawn) The assembly of claim 17, further comprising:

Applicants: Jeremy Stephen Matcham, et al. Attorney's Docket No.: 17638-008US1 / INTEU/P31704US

Serial No.: 10/584,780

Filed : September 28, 2007 Page : 9 of 18

a mechanism for temporarily permitting configured to temporarily permit delivery of a

quantity of liquid water to the one or more cathode fluid flow channels such that a relative

humidity of less than 100% is maintained when an exhaust temperature of a cathode of the one

or more fuel cells is below a predetermined threshold corresponding to a sub-optimal operating

temperature.

28 and 29. (Canceled)
